Experiment 2: Hotel Room Booking System

Aim

To develop a responsive hotel booking page that displays room types, prices, and lets users make a sample booking.

Algorithm

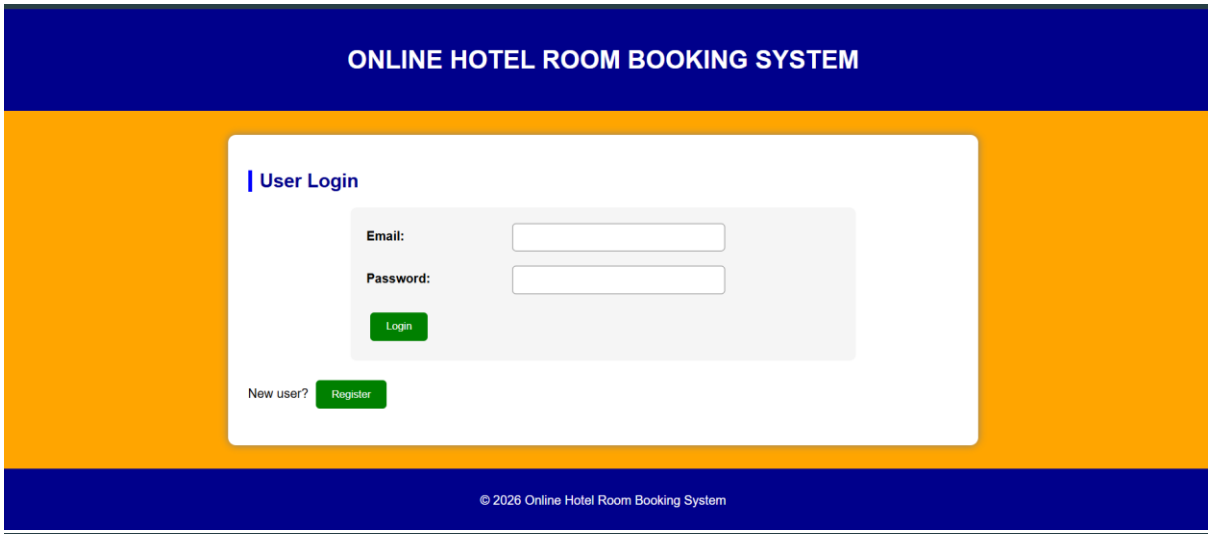

1. **Display hotel room options and prices.**
2. **Ask the user to enter guest name, room type and number of nights.**
3. **Calculate the estimated amount.**
4. **Validate the form.**
5. **Show booking confirmation.**

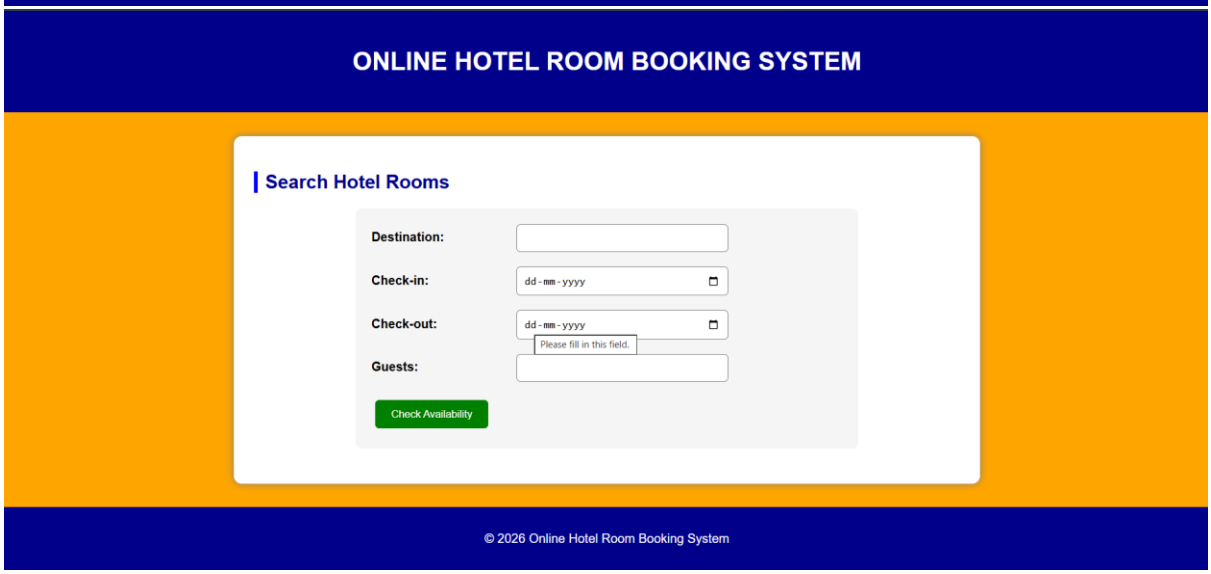

Program Code

```
<!DOCTYPE html>
<html><head><title>Hotel Booking</title><style>body{font-
family:Arial;background:#fff4e8;padding:25px}main{max-
width:650px;margin:auto;background:white;padding:22px;border-
radius:12px}input,select,button{padding:10px;margin:7px}button{background:#bd5b26;color:white;border:0}</styl
e></head><body><main>
<h1>Sunrise Hotel</h1><p>Standard ₹1500/night | Deluxe ₹2500/night | Suite ₹4000/night</p>
<input id="name" placeholder="Guest name"><select id="room"><option value="1500">Standard -
₹1500</option><option value="2500">Deluxe - ₹2500</option><option value="4000">Suite -
₹4000</option></select>
<input id="n" type="number" min="1" value="1" placeholder="Nights"><button onclick="book()">Book
Room</button><h3 id="out"></h3>
<script>function book(){let
name=document.getElementById('name').value,n=Number(document.getElementById('n').value),p=Number(document.get
ElementById('room').value);document.getElementById('out').textContent=name&&n>0?'Booking request for
'+name+'. Estimated total: ₹'+(p*n):'Enter a name and valid number of nights.';}</script>
</main></body></html>
```

Result

The page calculates the estimated room charge and displays a booking request. Real availability, payments and email confirmation require a backend service.
