Experiment 3: Bus Ticket Booking System

Aim

To create a bus booking page where users choose a route, date and seat count and view the estimated fare.

Algorithm

1. **Display route and journey-date inputs.**
2. **Let the user select a route and number of seats.**
3. **Calculate fare using the selected route rate.**
4. **Validate passenger details.**
5. **Display booking summary.**

Program Code

```
<!DOCTYPE html>
<html><head><title>Bus Booking</title><style>body{font-family:Arial;background:#e9fff5;padding:25px}main{max-width:620px;margin:auto;background:white;padding:22px;border-radius:12px}input,select,button{padding:10px;margin:7px}button{background:#087f5b;color:white;border:0}</style></head><body><main>
<h1>GoBus Ticket Booking</h1><input id="pass" placeholder="Passenger name"><select id="route"><option value="350">Chennai to Bengaluru – ₹350</option><option value="500">Chennai to Hyderabad – ₹500</option><option value="250">Chennai to Vellore – ₹250</option></select>
<input type="date" id="date"><input type="number" id="seats" min="1" value="1"><button onclick="reserve()">Book Ticket</button><p id="out"></p>
<script>function reserve(){let p=pass.value,n=Number(seats.value),r=Number(route.value);out.textContent=p&&date.value&&n>0?'Booking summary: '+p+', '+date.value+', '+n+' seat(s), total ₹'+(n*r):'Please complete all fields correctly.';}</script>
</main></body></html>
```

Result

The website displays a sample bus booking summary and calculates the total fare. Seat locking, payment and confirmation require server-side implementation.
