Experiment 5: Flight Reservation System

Aim

To build a flight search and booking form that shows a sample fare based on travel class and passenger count.

Algorithm

1. **Enter source, destination and date.**
2. **Select travel class and passenger count.**
3. **Validate the inputs.**
4. **Calculate the estimated fare.**
5. **Show the booking summary.**

Program Code

```
<!DOCTYPE html>
<html><head><title>Flight Booking</title><style>body{font-
family:Arial;background:#e7f8ff;padding:25px}main{max-
width:650px;margin:auto;background:white;padding:22px;border-
radius:12px}input,select,button{padding:10px;margin:7px}button{background:#087ca7;color:white;border:0}</styl
e></head><body><main>
<h1>SkyWay Flights</h1><input id="a" placeholder="From"><input id="b" placeholder="To"><input type="date"
id="d"><select id="c"><option value="3500">Economy ₹3500</option><option value="7000">Business
₹7000</option><option value="12000">First Class ₹12000</option></select><input type="number" id="n" value="1"
min="1"><button onclick="searchFlight()">Search / Book</button><p id="o"></p>
<script>function searchFlight(){let
n=Number(document.getElementById('n').value);o.textContent=a.value&&b.value&&a.value!==b.value&&d.value&&n>0?
'Sample flight found. Estimated fare: ₹'+(n*Number(c.value)):'Enter valid flight details.';}</script>
</main></body></html>
```

Result

The form validates travel details and shows a sample fare. Real-time flight inventory, payment and e-ticket generation need airline/API integration.
