Experiment 6: Online Cake Ordering System

Aim

To create a cake shop page where customers select a cake, enter quantity and delivery details, and calculate the order total.

Algorithm

1. **Display cake choices and prices.**
2. **Collect customer name, cake selection, quantity and delivery address.**
3. **Calculate the total price.**
4. **Validate required fields.**
5. **Display the order summary.**

Program Code

```
<!DOCTYPE html>
<html><head><title>Cake Shop</title><style>body{font-family:Arial;background:#fff0f6;padding:25px}main{max-width:620px;margin:auto;background:white;padding:22px;border-radius:12px}input,select,button{padding:10px;margin:7px}button{background:#c2255c;color:white;border:0}</style></head><body><main>
<h1>Sweet Treats 🍰</h1><select id="cake"><option value="500">Chocolate Cake ₹500</option><option value="650">Red Velvet ₹650</option><option value="400">Vanilla Cake ₹400</option></select><input id="name" placeholder="Customer name"><input id="qty" type="number" value="1" min="1"><input id="addr" placeholder="Delivery address"><button onclick="orderCake()">Place Order</button><p id="out"></p>
<script>function orderCake(){let q=Number(qty.value);out.textContent=name.value&&addr.value&&q>0?'Order placed in demo for '+name.value+'. Total ₹'+(q*Number(cake.value)):'Fill all fields correctly.';}</script>
</main></body></html>
```

Result

The page calculates the cake order total and shows a demo confirmation. Actual payment, stock control and delivery tracking require backend services.
